

Seminar Deep Learning SS 2026 Guidelines

General considerations:

- The seminar presentations are intended to convey as much technical insight as possible. Structure your presentation accordingly.
- No table of contents. Presentations are always intro/related work/method/experiments, no need to write and speak about that.
- Rough outline:
 - Title: 1 min
 - Intro/Problem description: < 5 min
 - Method/solution: > 50%
 - Experiments: 20-30%
 - In total: 30 Minutes duration -> longer duration will be penalized
- Problem description/Intro:
 - First simplified description: top view
 - Then more details
 - Potentially existing solutions and why they fail short
 - What deficiencies do you address, short description of results
- Method/Solution:
 - Since time is limited, make a good selection of the most important results. Also do not overload with formulas and pseudo-code. Present the most important methodological and technical contributions. If necessary to show formulas and (pseudo-)code, simplify as much as possible.
 - Same for figures.
- Experiments:
 - Experimental results are to be presented in a concise format: Do not copy experimental results tables but take the important numbers, possibly simplify, explain on which benchmark in words. Do not overload with information.
 - If you did your own experiments: Talk about your experimental experience: Was training stable, which hyperparameters (lr, batch size, ...) did you choose, how was training loss/validation error, ... over time looking like, did you overfit, what other interesting things did you observe.
- Last slide: Take home message, condensation of what is most important. Do not waste on "Thank you for attention" or similar

Miscellaneous:

- Add page numbers
- Use latex for formulas also when using powerpoint
 - IguanaTex
- Avoid messy templates
- Examples and illustrations might be good for making people understand

Organization:

- Send me your presentation at least one week before presenting. We will go over it together

Grading:

- Most important consideration: Did you deeply penetrate the topic, know details, ...
- Presentation: Could you convey the important conceptual and technical aspects
- Quality of reproduction (when applicable)
- Slide quality
